

Decision Dominance with Primer

National Security and Intelligence organizations leverage Primer’s mission-ready machine learning technology to secure strategic advantage and decision dominance in the field.

AI for the next-generation warfighter

Primer is a Series C tech company that works with National Security and Intelligence agencies to build and deploy next-generation AI solutions to meet rapidly evolving defense and security needs.

National Security is a part of Primer’s DNA. Initially seeded by InQTel, Primer’s first contracts were with National Security and Defense organizations. Our workforce, including top executives, is strongly rooted in National Security, Defense, Intelligence, and the Public Sector, and our advisory board includes a Former Commander of the U.S. Special Operations Command, a Former U.S. Intel Chief, and a Former Principal Deputy Director of Intelligence.

“AI is a technology so powerful that the country that wields it will quickly defeat any opponent who does not....The stakes are high, and the winner of this AI arms race will become the dominant military power in the world. It is a race that we cannot afford to lose.”

- Sean Gourley, CEO, testifying at the U.S. Chamber of Commerce AI Commission

Key capabilities

Primer’s AI capabilities scale from off-the-shelf applications to secure on-premises deployments, trained on state-of-the-art custom models against customer data sets. Primer’s AI-powered solutions provide immediate value for improved situational awareness and decision support by offering:

Real-time contextual intelligence to better understand a complex information environment including potential cyber threats.

“Primer’s tools “Analyze” and “Command” were incredibly helpful for [our] community to quickly break down and understand the information environment as it pertained to crisis assessment. Specifically the automated NLP embedded in the tools was extremely advanced and made understanding millions of data points quick and easy. Without the assistance of these tools, it would have been impossible to understand an increasingly complex and diffuse information environment at a critical point for [our organization].

- Data Scientist [Undisclosed Agency]

Detection and monitoring of adversarial intent to inform information operations countermeasures.

“Military commanders and business leaders live in an increasingly complex information environment, which is a morass of equal parts champagne and swill. Rapidly sorting through fact and fiction and pertinent information to enable time-sensitive decisions is both more important and more difficult. Primer’s technology greatly enhances the ability to perform this critical, in some cases existential, function.”

– Tony Thomas, Former Commander, US Special Operations Command

Self-generating and updating knowledge bases to support strategic analysis across disparate data sources.

“The true benefit that must be emphasized...is the rapidity with which an analyst can acquire disparate information with Primer...The resultant time savings afforded to the analyst are a quality improvement that is difficult to quantify because that time will almost unwittingly be reinvested in diving deeper down the analytical rabbit-hole to gain more situational awareness.”

– Intelligence Analyst [Undisclosed Agency]

Tools to fine-tune machine learning models, to meet evolving mission needs, and serve them reliably at scale.

“Having dedicated most of my life to intelligence and having spent decades leading critical missions where information was essential in shaping our understanding of the operational landscape, I understand the value of Primer’s technology.”

– Hank Crumpton, Former Ambassador-at-large and US Coordinator for Counterterrorism
